

## **Module 1: Example HTML Description**

I used Microsoft VS Code to view the source code for the HTML document. I rewrote my HTML edits in this environment and copied this code to a text file. Next, I opened the text file as a .html document to see the changes that were made.

I viewed and edited my changes using the Google Chrome browser with Version 95.0.4638.69 (Official Build) (64-bit). My operating system is Windows 10 and my computer architecture is a 64-bit operating system, x64-based processor.

Since my .html file uses images via a URL, I do not have to send files to the users that want to view my webpage. Rather, I would send my single .html file containing the source code to the users that want to view my webpage and it would be able to load onto their computers.
